

Service name:	Training program: SMART PRODUCTION SYSTEMS
Service description:	<p>he proposed professional development program for the jobs of managers of automated technological processes, organized according to the Smart Production Systems model, would represent a starting point, or a minimum level of professional qualification for performing the jobs of managers of such production. These jobs primarily involve carrying out the necessary tasks related to the introduction, development and improvement, as well as simpler maintenance tasks of modern production systems that mostly have production equipment with a high degree of automated features. The introduction of such a production concept is in line with modern trends in production. Based on the competencies acquired upon completion of this program, individuals can plan, implement and monitor various specific production processes. The need for such educated individuals is present in productions that require uniformity of quality, standardization and reliability. Production processes that are carried out on highly automated production equipment enable the achievement of a high level of production and its sustainability.</p> <p>The development and improvement of the level of production is not achievable without appropriate production equipment but also appropriate qualifications of the persons who work with such equipment. Production equipment is continuously improved in terms of technology and functionality, and its installation in the production process actually just begins the improvement of production. For this reason, the proposed training program is only one in a series of activities that should be implemented and thus ensure the functionality of automated production.</p> <p>Production that is not based on modern concepts eventually becomes unsustainable and a generator of financial illiquidity and, in the long run, leads to the suspension of production. In order to avoid such a scenario, it is necessary to continuously invest in production resources, primarily production equipment, but also in people who lead, plan and manage production processes. This professional training program enables a balanced improvement of production.</p>
